

How to Fetch Data from Magento2 Tables in .phtml files?

Today we're going to cover fetching of data from **Magento 2 tables**. We can use the following codes for fetching such data via object manager. Here is how to complete this fetching process successfully:

```
$this->_resources =  
\Magento\Framework\App\ObjectManager::getInstance()->get('Magento\Framework\App\ResourceConnection');
```

```
$connection= $this->_resources->getConnection();
```

```
$themeTable =  
$this->_resources->getTableName('converge_token');
```

```
$sql = "select * from " . $themeTable . "where  
customer_id='$customerId'";
```

```
$result = $connection->fetchAll($sql);
```

If you follow the code mentioned above, you will be able to easily fetch data from [Magento 2](#) tables. Keep looking out for our upcoming "[How to](#)" blog posts on Magento 2.
